CLINICAL SUPPER

'Critical Periods Re-examined: Lessons from Cataract- Reversal Patients'

When the cataracts are present from birth, many visual abilities fail to develop normally e.g., acuity; motion perception; recognition of facial identity, a pattern indicating that early visual input is necessary to set up, or preserve, the neural architecture that allows these abilities to be refined later in development.

Professor Daphne Maurer

Department of Psychology, Neuroscience, & Behaviour
McMaster University, Canada

5pm, Tuesday 16th November 2010

Level 2 Function Room
Administration Building
Princess Margaret Hospital for Children

Pizza and refreshments will be served
All welcome
